CLAIMS

We Claim:

1. A reactive personnel protection system of the type in which at least one air bag is inflated responsive to detection of a projectile prior to contact between said projectile and a person, said system comprising:

a radar-based projectile detection system;

at least one rapidly deployable air bag; and

in response to detection of the approach of said projectile in proximity to said person by said detection system.

- 2. The system of Claim 1 wherein said radar based projectile detection system operates at a frequency of 8-20 Ghz.
- 3. The system of Claim 1 wherein said radar based projectile detection system operates at a frequency of 10.5 Ghz.
- 4. The system of Claim 1 where in said rapidly deployable air bag is interposed between said projectile and said person upon deployment.
- 5. The system of Claim 1 wherein said rapidly deployable air bag is deployed across an opening into a room located between said

person and salid object.

- The system of Claim 1 wherein said rapidly deployable air bag is constructed from an ultra-high molecular weight polyethylene material.
- The system of Claim 1 wherein said rapidly deployable air bag is constructed from *FECTRA® material.
- The system of Claim 1 wherein said rapidly deployable air bag is constructed from KEVLAR® material.
- The system of Claim 1, /wherein said radar based projectile detection system has anti-jamming electronics.

10. A reactive personnel protection system of the type in which at
least one air bag is inflated responsive to detection of a
concussive shock wave prior to arrival of said shock wave at the
location of a person, said system comprising:

- a shock wave detection system;
- at least one rapidly deployable air bag; and
- in response to detection of the movement of said shock wave toward said location of said person by said detection system.
- 11. The system of Claim 10 wherein said rapidly deployable air bag is interposed between said shock wave and said person upon deployment.
- 12. The system of Claim 10 wherein said rapidly deployable air bag is deployed across an opening into a room located between said person and said shock wave.
- 13. The system of Claim 10 wherein said rapidly deployable air bag is constructed from an ultra-high molecular weight polyethylene material.
- 14. The system ϕ f Claim 10 wherein said rapidly deployable air bag is constructed from SPECTRA® material.

_17. A method to reactively pro	otect personnel from the rapid
approach of an object by deploym	ent of an air bag prior to the
arrival of the object at the location	on of said personnel, comprising
the steps of:	

detecting the approach of said object;

discriminating the presence of said object with respect to the presence of electronic noise;

activation of a gas-generation system in response to discrimination of the presence of said object; and deployment of an air wag between said object and said personnel responsive to said activation of said gas-generation system.

- 18. The method of Claim 17, wherein said detecting step is accomplished using a radar-based projectile detection system and wherein said object is a pallistic projectile.
- 19. The method of Claim 18, wherein said radar-based projectile detection system operates at a frequency of 8-20 Ghz.
- 20. The method of Claim 18, wherein said radar-based projectile detection system operates at a frequency of 10.5 Ghz.
- 21. The method of claim 17, wherein said air bag deployment is accomplished across an opening into a room located between said
